Swiss + made

Why is an implant good for you?

A dental implant adopts the natural function of a tooth root. If healthy teeth need to be ground for a bridge construction, if teeth are already missing in the molar region or if your own teeth are no longer present, then implants can help to give you more quality of life.

Make the right decision

Titanium is a metal

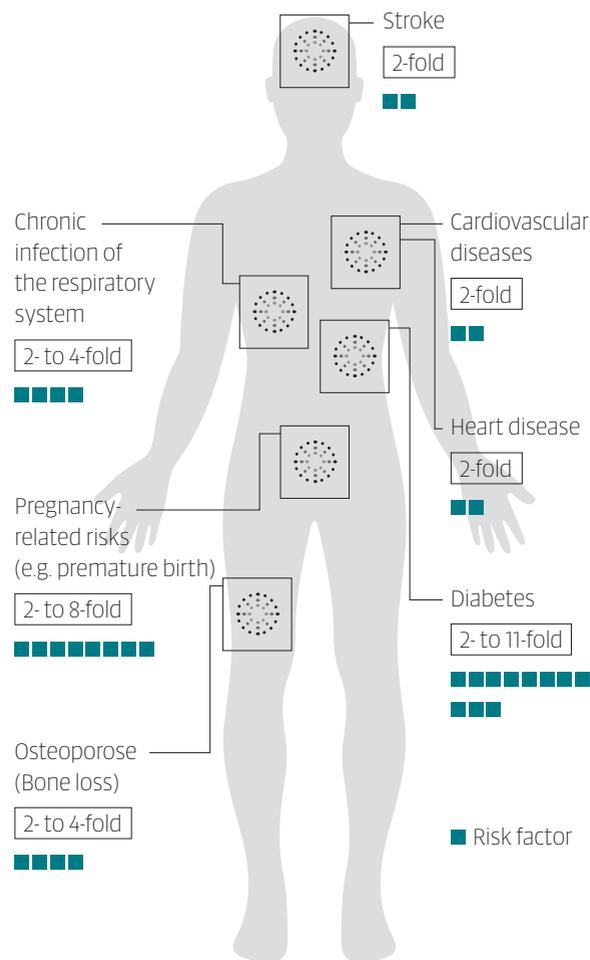

- » This can lead to allergic reactions or titanium incompatibilities.
- » This can lead to discomfort as it conducts electrical energy.
- » In case of receding gums or thin bone, the dark gray intrinsic color of titanium may shimmer through and be unsightly.

Recession of the gums around a titanium implant

Alternative: ceramic solution

Healthy teeth - healthy body

Zirkolith® – the right choice

Zirkolith® is distinguished by our own manufacturing process and offers you special advantages compared with other ceramics used

- » Zirkolith® demonstrates **extremely low adhesion of bacterial plaque**, the main cause of gum diseases such as periodontitis. Untreated periodontitis can increase the risk of many organic diseases, such as diabetes, risks during pregnancy, osteoporosis or cardiovascular disease
- » Our implants can be ground like natural teeth without problems and do not require complex accessories. This makes your dentist's work safe and easy – and **guarantees perfect esthetics**.
- » Together with ceramic drills and instruments we offer complete metal-free restoration – the **best alternative for patients suffering from allergies**.
